

## First milestones for the new Cyber Security Project - PANOPTESEEC

The EU-funded project PANOPTESEEC that was launched last November will address the challenge of modern networks and systems to detect vulnerabilities and possible attacks on sensitive information and essential services by developing a system that will empower individuals, companies and organisations in handling security incidents. Some of the first milestones have already been reached, including the requirements collection workshop defining the technologies and applications to be developed during the project lifetime. The near market-ready system will be first used by ACEA, one of the largest Italian public utility companies for power and water supply. The European consortium that will develop this beyond-state-of-the-art prototype consists of eight partners from academia, research and industry in Belgium, France, Germany and Italy.
